MPG Ai TS series

Micro-Star International
微星科技股份有限公司

Winning Reason

The MPG Ai TS series redefines system reliability with its GPU Safeguard+ technology, introducing a proactive protection logic for high-performance setups. By detecting GPU current anomalies in real-time, the system provides instant alerts and a critical buffer period, preventing data loss or hardware damage caused by sudden power failures. Unlike conventional products that react passively after a fault occurs, this series integrates monitoring, notification, and risk mitigation into a comprehensive framework. It ensures both system continuity and user safety, showcasing a significant innovation in high-end power supply reliability and human-centric protection.

Product Feature

The MPG Ai TS Series, driven by a breakthrough proprietary hardware integration: an advanced IC (Integrated Circuit) embedded directly into the power supply. This component is not a mere power supply; it is a 24/7 GPU Safeguard. When a threat is detected, it triggers a chain of proactive protection mechanisms. By integrating the IC's real-time data into the MSI Center software, the PSU actively reaches out to the user. An anomaly triggers an immediate, a visual window pop-up on the desktop interface. This unique, user-directed notification is a paradigm shift. Instead of discovering a catastrophic failure weeks later, the user is alerted to the problem at the precise moment it begins.
